

Figure 1 is a plot titled "Age-dependent $p < 0.05$ ". The x-axis is labeled "Dx age (years)" and ranges from 20 to 90. The y-axis represents the probability $p < 0.05$. The plot shows a red line with a shaded confidence interval, indicating a decreasing trend in $p < 0.05$ as age increases. Data points are represented by open circles, with a higher density of points at lower ages and a more sparse distribution at higher ages.
