

Not age-dependent  $p > 0.01$

The forest plot displays the association between age and the risk of stroke. The x-axis represents the risk ratio on a logarithmic scale, with a vertical line at 1.0 indicating no effect. The plot shows a red line for the pooled effect size and a shaded area for the confidence interval. The plot indicates that the association is not statistically significant ( $p > 0.01$ ).

Not age-dependent  $p > 0.01$

The forest plot displays the association between age and the risk of stroke. The x-axis represents the risk ratio, with a vertical line at 1.0. The plot shows a red line for the pooled effect size and a shaded area for the confidence interval. The plot is labeled "Not age-dependent  $p > 0.01$ ".

Not age-dependent  $p > 0.01$

The forest plot displays the association between age and the risk of stroke. The x-axis represents the risk ratio on a logarithmic scale, with a vertical line at 1.0 indicating no effect. The plot shows a red line for the pooled effect size and a shaded area for the confidence interval. The plot indicates that the association is not statistically significant ( $p > 0.01$ ).

A horizontal number line with tick marks at 20, 40, 60, and 80.

A horizontal number line with tick marks at 20, 40, 60, and 80.

A horizontal number line with tick marks at 20, 40, 60, and 80.

A horizontal number line with tick marks at 20, 40, 60, and 80.
