

Figure 1 is a plot showing the relationship between Dx age (years) and the probability of being in the top 10% of the distribution of age at onset. The x-axis represents Dx age (years), ranging from 20 to 80. The y-axis represents the probability, with a horizontal line at 0.1. A red line shows the estimated probability, which is relatively flat around 0.1. A shaded area represents the confidence interval. Data points are shown as open circles, with a dense cluster around the red line and a few outliers above and below.
